

Jewelweed (*Impatiens* spp.)

Notes:

There are two species of *Impatiens* in Indiana, both of which are native and generally woodland species. These species are easy to identify. The flower structure and leaf patterns are enough to identify them.

I. capensis has orange flowers and is generally a shorter plant that grows in colonies usually in wetter places.

I. pallida is taller with yellow flowers and not as clumpy. It is less common and grows in dryer places than *I. capensis*.

Jewelweed (<i>Impatiens capensis</i>)	Pale touch-me-not (<i>Impatiens pallida</i>)
	
Orange flowers	Yellow flowers

Shorter plant grows in colonies

Taller plant grows singly

Leaves look about the same.
